

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) A soldered refrigerant condenser, comprising:
a heat exchanger network with flat tubes and corrugated ribs,
collecting tubes which are fluid-connected to the flat tubes, and
a header which is arranged parallel to one of the collecting tubes and which receives within it a dryer and/or filter and is fluid-connected to the collecting tube via overflow orifices,
wherein the dryer is formed by a space which receives a dryer medium and which is delimited by a portion of the header and two closing plates passing through the cross section of the header,
wherein an elastically prestressed pressure plate is arranged between an upper closing plate and the dryer medium which comprises a granulate,
wherein the portion containing the dryer granulate is arranged in an upper region of the header, preferably in an upper third, in relation to the total height H of the header, and
wherein the filter is arranged in a lower region of the header between two overflow orifices.
2. (Presently Presented) The condenser as claimed in claim 1, wherein at least one of the closing plates is designed as a perforated plate.
3. (Previously presented) The condenser as claimed in claim 1, wherein the portion of the header is widened in its cross section with respect to adjacent regions.
4. (Presently Presented) The condenser as claimed in claim 3, wherein the header is designed as a tube and the widened portion is produced by expansion.
5. (Previously Presented) The condenser as claimed in claim 1, wherein a felt layer is arranged between a lower perforated plate and the dryer medium which comprises a granulate.

6. (Cancelled)
7. (Presently Presented) The condenser as claimed in claim 1, wherein the closing plates form a firm connection with the wall of the header.
8. (Presently Presented) The condenser as claimed in claim 7, wherein the connection is frictional.
9. (Presently Presented) The condenser as claimed in claim 7, wherein the connection is positive.
10. (Presently Presented) The condenser as claimed in claim 7, wherein the connection is materially integral.
11. (Previously Presented) The condenser as claimed in claim 1, wherein said closing plates comprise an upper closing plate and a lower closing plate and upper closing plate is designed as a closure of the header.
12. (Cancelled)
13. (Cancelled)
14. (Currently Amended) The condenser as claimed in claim [[13]] 1, wherein the filter is designed as a cup-shaped close-mesh sieve.
15. (Previously Presented) The condenser as claimed in claim 14, wherein the sieve has an annular edge region which is firmly connected to a wall of the header.
